

Canine Veterinary Check-Up

Directions:

- Set up a patient room (you can use your bed, couch or the floor)
- Have a parent or sibling be the dog's owner and tell you about how their dog will not stop itching
- Ask the owner the questions on the **evaluation sheet (uploaded to website)**
- After completing the worksheet, complete the following laboratory testing (if you are doing this check-up on your dog, **do NOT** actually swab their ears or pluck their hair. Just get close enough to make it look like you are). Tests are below:

Laboratory Testing:

Ear Swab—to identify any infections in the ear including yeast and/or bacteria

Skin Scrape/Hair Pluck—to detect scabies or demodex mites

Impression Smear/Tape Prep—to detect other parasites and check for presence of yeast and/or bacteria
